

SSL Certificate Rotation Automation

Operations Training Deck · Let's Encrypt on Windows Server & Azure Web Apps

NOC / Infrastructure Operations

Companion to the Cert-Man-Windows handbook

Start here

Which runbook do I use?

Pick the right path for any certificate based on what needs it and how it's exposed.

Public IIS website, port 80 reachable, no wildcard. win-acme issues, binds, and auto-renews.

Windows DNS-01 & Wildcard

Wildcard, internal host, or port 80 blocked. Validate via the DNS provider's API.

CNAME Delegation (on-prem DNS)

Internal/API-less DNS? Delegate only the `_acme-challenge` record to an API-capable zone.

RDP, SQL Server, Exchange, custom HTTP.SYS: renew, then a post-renewal script re-binds & restarts.

Runbook 04

Azure Web App — Acmebot (primary)

Managed, hands-off: cert lands in Key Vault, App Service auto-imports within 24h.

Runbook 05 Azure Web App — Posh-ACME (alternative)

Scripted path: an Azure Automation runbook issues, uploads to Key Vault, and persists state.

Monitoring & Alerting

Automation fails silently — dual-layer monitoring catches both the outage and its cause.

Runbook 08

Replacing an Existing Cert (any vendor)

Take over a self-signed default, GoDaddy, DigiCert, or any cert: Let's Encrypt issues fresh and re-binds. Inventory → cutover → clean up.
